AI Use Disclosure

Our team used several AI-powered tools, including ChatGPT, Mizou, and Base44, to support the development of our AI chatbot project, *Boredom Buster AI*.

We used ChatGPT to explore chatbot features, develop and refine instructions, configure and test initial chatbot prototypes, and troubleshoot technical issues encountered during development.

Additionally, we explored Mizou and Base44 to design, configure, and test chatbot prototypes. These platforms helped us evaluate different approaches to implementing our chatbot and providing personalized activity recommendations.

Throughout the project, our team actively participated in platform evaluation, chatbot configuration, testing, and decision-making. AI tools were used to support our work rather than replace our independent thinking, collaboration, or evaluation of the results.
